FOI 0469_2025 Response

System definitions:
Adult (working age) services: This may be an independent system for managing these patients, or it may be part of the trust's EPR functionality.

Bed Management: Real-time bed states are viewable and accessible, enabling more efficient management of bed occupancy and patient movements.

Child and Adolescent Mental Health Services (CAMHS): Is a broad term for all services that work with children and young people who have difficulties with their emotional or behavioural wellbeing.

Discharge Letters: The ability to electronically generate and send detailed discharge letters to GPs and other relevant HCPs, when a patient is discharged from hospital-based services.

Document Management: Converts records into electronic format so that they can be viewed, moved around, and managed electronically on screen. Acts as a live filing system.

Eating disorders: This may be an independent system for managing these patients, or it may be part of the trust's EPR functionality.

EPR: An electronic patient/health record is an electronic record of periodic health care of a single individual, provided mainly by one institution. A digital version of a patient's paper chart.

Health Information Exchange (HIE): A system which allows health care providers and patients to appropriately access and securely share a patient's vital medical information electronically.

Inpatient e-prescribing: Advanced e-prescribing in use across wards for inpatient care, incorporating specialist prescribing and (ideally) clinical decision support, integrated as part of end-to-end medicines management. This possibly offers the single biggest opportunity for improving patient safety through digitalisation.

Trust Integration Engine (TIE): Trust Integration Engine (TIE)-Integration engine enables trust merger sites to access clinical systems through one consistent, secure platform.
